## Research Group Description

**Leonardo Sorci**, Ph.D. in Biomedical Biotechnologies, Associate Professor of Bioinformatics and Biochemistry ([ORCID](#), [CV link](#), [publications](#), H-index 24), former Staff Scientist at Sanford-Burnham-Prebys medical discovery institute, San Diego, California, joins forces with other colleagues at UNIVPM to bring their complementary skills in the area of Biochemistry (**BIOS-07/A Biochemistry**), sharing their long-term expertise in **NAD cofactor** genomics, metabolism and enzymology.

**Interdepartmental Bioinformatics and Biochemistry lab (IBBL)**

**SIMAU (Bioengineering)**

### Department description

[\(https://simau.univpm.it/en/homepage-english/\)](https://simau.univpm.it/en/homepage-english/)

The **Department of Science and Engineering of Materials, Environment and Urban Planning (SIMAU)** is a structure in which the **confluence of different expertises** yield high-level teaching and high-profile international research in the field of **Science of Matter** and **Earth Sciences** with a special focus toward the **Environment**.

It operates within the **Engineering Faculty** offering teachers specialised in the so-called «hard sciences» (**Chemistry** and **Physics**) as well as teachers involved in more «applicative» fields, such as **Materials Engineering**, **Geotechnics**, **Geology**, **Environmental Engineering** and **Urban Planning**.

- **TECHNICAL ARCHITECTURE**
- **BIOINFORMATICS AND BIOCHEMISTRY**
- **ECOLOGY**
- **ECONOMICS AND MARKETING**
- **EXPERIMENTAL PHYSICS**
- **CHEMICAL FOUNDATION OF TECHNOLOGIES**

**Supervisor:** Prof. Leonardo Sorci

**Lab skills/expertise:** **wet-lab** approaches  
relevant to antimicrobial research

②

### GENE CLONING

③

### PROTEIN EXPRESSION

### PROTEIN PURIFICATION

Column  
Chromatography

④

### PROTEIN CHARACTERIZATION

- Bioch properties
- Bioassay
- Kinetics
- 3D Structure

⑤

### LEAD DISCOVERY

- HTS screening
- Cheminformatics artifact filter
- Hit confirmation and selection
- Dose response ( $\text{IC}_{50}$ ,  $\text{K}_i$ )
- Inhibition mechanism
- Counterscreen

**Lab skills/expertise: *in silico* and AI-powered approaches relevant to antimicrobial research**

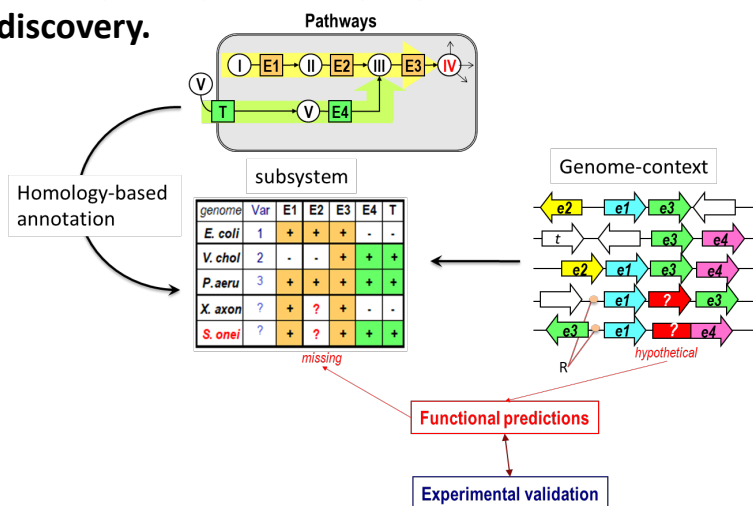

**Gene/protein identification and prediction by sequence (*homology*) and comparative genomics (*gene-fusion, clustering, co-regulation*) approaches**

## **Project Idea: AI-powered biochemistry: targeting NAD cofactor essentiality to combat antimicrobial-resistant pathogens**

**Background:** NAD cofactor metabolism, which is essential for all pathogens, contains several promising drug targets—specifically, between two and five key enzymes that could be exploited to combat infectious diseases. This approach is especially valuable for addressing bacterial infections, given the growing crisis of multidrug resistance. Since bacteria and other pathogens have not yet evolved defenses against them, new NAD-based antibiotics are expected to remain effective for decades to come.

**Objectives:** By combining advanced AI-driven biochemistry and drug discovery with our deep expertise in NAD enzymology and structural biology, we aim to develop novel drug candidates targeting pathogens most prone to antibiotic resistance, thus addressing a critical public health challenge. Our target pathogens include, but are not limited to:

*Acinetobacter baumannii* and other gram-negative enterobacteria, which represent an active and growing threat in Europe due to their high propensity for developing antibiotic resistance. *Mycobacterium tuberculosis*, a re-emerging deadly pathogen driven by the rise of multi-drug-resistant strains. *Plasmodium species (malaria parasites)*, whose potential re-emergence is linked to climate change, increased global travel, and migration patterns. *Schistosoma mansoni*, a parasitic flatworm causing significant disease burden in endemic regions. parasite (flatworm)
